The bed of ashes is maintained of the desired depth, and the surplus ashes removed by rotating the grate a by means of gears worked through the crank c. As the grate is placed at some distance below the conical casing or bosh, the ash discharges uniformly around its periphery when it is revolved. This causes a uniform settling of the bed lr of ash, and also lets the bed of fuel settle so as to close up any channels which have been formed in it by the blast. The scrapers d, projecting a short distance into the ash bed, help the discharge of ash from the grate. The depth of the bed of ashes insures that the ash is completely burned and cooled before it is finally discharged. Producer Plants. Producer plants are of two kinds; the flow of air through...
